Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 14
G83551
hypothetical protein BH0015 [imported] - Bacillus halodurans (strain C-125)
C;Species: Bacillus halodurans
C;Decies: OnDiec-2000 #sequence_revision 01-Dec-2000 #text_change 09-Jul-2004
C;Accession: G83551
R;Takami, H.; Nakasone, K.; Takaki, Y.; Maeno, G.; Sasaki, R.; Masui, N.; Fuji, F.; Hira
Nucleic Acids Res. 28, 4317-4331, 2000
A;Title: Complete genome sequence of the alkaliphilic bacterium Bacillus halodurans and A;Accession: G83651
A;Accession: G83651

"Crystal structure of gingipain R: an Arg-specific bacterial cysteine
proteinase with a caspase-like fold.";
EMBO J. 18:5453-5462(1999).

-!- FUNCTION: Thiol protease which is believed to participate in intracellular degradation and turnover of proteins. Its proteolygic activity is amajor factor in both periodontal tissue destruction and in bacterial host defense mechanisms. Activates complement C3 and C5 By similarity).

-!- CATALYTIC ACTIVITY: Hydrolysis of proteins and small molecule substrates, with a preference for Arg in P1.

-!- ENZYME REGULATION: Inhibited by human histatin-3 1/24 (histatin-

                                                                                                                                                                                                                                                                                        Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License
                                                                    CATALYTIC ACTIVITY: Hydrolysis of proteins and small molecule substrates, with a preference for Arg in Pl.
ENZYME REGULATION: Requires cysteine for activation and Ca(2+) and/or Mg(2+) for stabilization. It is stimulated by glycinecontaining dipeptides. It is resistant to inhibition by proteinase inhibitors in human plasma.
SIMILARITY: Belongs to the peptidase C25 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License
    intracellular degradation and turnover of proteins. Its proteolytic activity is a major factor in both periodontal tissue destruction and in bacterial host defense mechanisms. Activates

Immunogenic composition containing new Porphyromonas gingivalis peptides - and related antibodies, useful for treatment, prevention and diagnosis of peridontal disease.

Claim 1; Page 49; 70pp; English.

Peptides AAW83070-122 are derived from the 300 kD multiprotein complex of cysteine proteinases and adhesins. The 300kDa multiprotein complex is the major virulence factor of Porphyromonas gingivalis. The specification describes a composition for raising an immune response against P. gingivalis which contains at least one of the present peptides. The products are used to treat and prevent P. gingivalis infection (periodontal disease). Antibodies are used for passive immunisation, and

```
The present sequence represents a fragment of the PrtIIK48 lysine specific proteinase of Porphyromonas gingivalis. The specification describes beptides derived from the 300 kD multiprotein complex of cysteine proteinases and adhesins. The 300kDa multiprotein complex is the major virulence factor of P. gingivalis. The specification describes a composition for raising an immune response against P. gingivalis which contains at least one of the present peptides. The products are used to treat and prevent P. gingivalis infection (periodontal disease). Antibodies are used for passive immunisation, and as diagnostic reagents for P. gingivalis in subgingival plaque. The peptides are used to detect P. gingivalis in serum
                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic composition containing new Porphyromonas gingivalis peptides - and related antibodies, useful for treatment, prevention and diagnosis of peridontal disease.
gents for P. gingivalis in subgingival plaque. The to detect P. gingivalis specific antibodies in serum

transportation relates to an isolated immunogenic Purphyromonals glugivalisty

C animo acids of an amino acid sequence appearing as ADZ10349. ADZ10445.

DADZ10445 - ADZ10449 or ADZ10490-ADZ10571, (b) the polypeptide of (a) and animo acid sequence selected from a heterologous polypeptide or (c) an amino acid sequence selected from ADZ10384 - ADZ10443. ADZ10445 - ADZ10478 or ADZ10480-ADZ10571. Also included are an isolated polymucleotide (comprising a sequence poetably corrected (c) (a), (b) or (c)), an expression control sequence operably corrected (c), an expression control sequence of antibody fragment, or single-chain antibody) that specifically binds to composition comprising the antibody (antibody corrected) composition comprising the soluted immunogentic polymetric) and a pharmaceutical carrier, corrected (c) and a pharmaceutical carrier, corrected (c) and a pharmaceutical carrier, eliciting an immune response in an animal, detecting the presence of a first P. gingivalis or prevention of a pharmaceutical carrier, eliciting antibody in a test sample, detecting the presence of E. gingivalis (or a P. gingivalis polypeptide) in a test sample, detecting the presence of E. gingivalis infection, and amelioration of diseases and infections caused treatment, prevention, and amelioration of diseases and infections caused by gingivalis infection in a subject and detecting P. gingivalis in a composition of generalized juvenile periodontitis, generalized juvenile periodontitis, represented adult progressive adult periodontitis, repre

P. gingivalis infection in a subject and detecting P. gingivalis in a subject. The immunogenic polypeptide is useful for the diagnosis, treatment, prevention, and amelioration of diseases and infections caused by P. gingivalis. It is useful for treating or preventing localized prepubertal periodontitis, generalized prepubertal periodontitis, representable periodontitis, rapidly prospressive adult periodontitis, refractory adult periodontitis, refractory adult periodontitis, endocarditis, thyroid gland abscess, uninary tract infection, brain abscess, or vertebral osteomyelitis. The present sequence is a P. gingivalis immunogenic protein of the invention.

The invention relates to an isolated immunogenic Porphyromonas gingivalis polypeptide (I) comprising (a) a polypeptide at least about 5 contiguous amino acids of an amino acid sequence appearing as ADZ10384 - ADZ10478.

ADZ10445 - ADZ10478 or ADZ10480-ADZ10571, (b) the polypeptide of (a) and a heterologous polypeptide or (c) an amino acid sequence selected from ADZ10443 - ADZ10443, ADZ10445 - ADZ10480-ADZ10571. Also conditioned are an isolated polymucleotide (comprising a sequence that encodes (I) (a), (b) or (c)), an expression control sequence operably linked to the polymucleotide above (or the polymucleotide above and a cherologous polymucleotide), an expression vector comprising the cherologous polymucleotide), an expression vector, an antibody carrient polymucleotide, a nost cell comprising the expression vector, an antibody cannot be polymucleotide and antibody) and a pharmaceutical carrier, the polypeptide, a composition comprising the antibody (antibody creating or preventing a disease/infection caused by Porphyromonas control comprising the isolated immunogenic polypeptide (or the polymucleotide) and a pharmaceutical carrier, eliciting an immune creaponal detecting the presence of a first P. gingivalis composition comprising the presence of a first P. gingivalis composition cannot be presence of a first P. gingivalis composition at the presence of a first P. gingivalis composition at the presence of a first P. gingivalis composition antibody in a test sample, detecting the presence of P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; enzyme; therapy; diagnosis; periodontal disease; antinflammatory; mouth disease; gingivitis; inflammation; mouth disease; endocarditis; cardiant; cardiovascular disease; inflammation; bacterial urinary tract infection; antibacterial; uropathic; genitourinary disease; infection; osteomyelitis; osteopathic; musculoskeletal disease; antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated immunogenic polypeptide, useful for diagnosing, treating, preventing, or ameliorating diseases and infections caused by Porphyromonas gingivalis e.g. localized prepubertal periodontitis.

```
The invention relates to an isolated immunogenic Porphyromonas gingivalis polypeptide (1) comprising (a) a polypeptide at least about 5 contiguous amino acids of an amino acids sequence appearing as ADZ10344 - ADZ10443, ADZ10445 - ADZ10445 - ADZ10445 - ADZ10445 of (a) an amino acid sequence selected from a heterologous polypeptide or (c) an amino acid sequence selected from ADZ10384 - ADZ1043, ADZ10445 - ADZ10446 - ADZ10446 - ADZ10445 of (a) and included are an isolated polynoclectide (comprising a sequence that encodes (1) (a), (b) or (c)), an expression control sequence operably linked to the polynuclectide above (or the polynuclectide above and a heterologous polynuclectide above (or the polynuclectide, an expression vector comprising the polynuclectide, an expression vector, an antibody
                                                                                                                                                                                                                                                                                                                        mouth disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated immunogenic polypeptide, useful for diagnosing, treat preventing, or ameliorating diseases and infections caused by Porphyromonas gingivalis e.g. localized prepubertal periodontitis.
                                                                                                                                                                                                                                                                                               Vaccine; enzyme; therapy; diagnosis; periodontal disease; antiinflammatory; mouth disease; gingivitis; inflammation; moundocarditis; cardiant; cardiont; ardiant; ardiant; ardiant; ardiant; service abacterial; urinary tract infection; antibacterial; uropathic; genitourinary disease; infection; osteomyelitis; osteopathic;
                                                                                                                                                                                                                                                            P. gingivalis lysine-specific cysteine proteinase SEQ ID 176.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Handfield M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   English

c (antibody fragment, or single-chain antibody) that specifically binds to the polypeptide, a composition comprising the antibody (antibody fragment, or single-chain antibody) and a pharmaceutical carrier, creating or preventing a disease/infection caused by Porphyromenas gingivalis, a composition comprising the isolated immunogenic polypeptide carginals of a composition comprising the presence of a first p. gingivalis an animal, detecting the presence of a first p. gingivalis antibody in a test sample, detecting the presence of P. C. gingivalis infection in a subject and detecting the presence of P. Gingivalis infection in a subject and detecting P. gingivalis in a subject, and amelioration of diseases and infections caused C. P. gingivalis. It is useful for treatment, prevention, and amelioration of diseases and infections caused C. Py P. gingivalis. It is useful for treating or preventing localized complexed periodontitis, generalized prepubertal periodontitis, crapidly progressive adult periodontitis, refractory adult periodontitis, rapidly progressive adult periodontitis, refractory adult periodontitis, abscess, or vertebral osteomyellitis. The present sequence is a P. distance is a P. disconting of the immension of the immension of the immension of the immension of the immension of the immension of the immension of the immension of the immension of the immension of the immension of the present sequence is a P.

```

```
polypeptide (I) comprising (a) a polypeptide at least about 5 contiguous conino acids of an amino acid sequence appearing as ADZ10384 - ADZ10443, CC ADZ10445 - ADZ10445 - ADZ10445 - ADZ10445 - ADZ104460-ADZ10571, (b) the polypeptide of (a) and amino acid sequence selected from a heterologous polypeptide or (c) an amino acid sequence selected from ADZ10384 - ADZ10443, ADZ10445 - ADZ10478 Or ADZ10480-ADZ10571. Also included are an isolated polynuclectide (comprising a sequence operably encodes (I) (a), (b) or (c)), an expression control sequence operably condition and polynuclectide above (or the polynuclectide above (or the polynuclectide), an expression vector comprising the heterologous polynuclectide above (or the polymptide, a composition comprising the antibody (antibody tragment, or single-chain antibody) that specifically binds to treating or preventing a disease/infection caused by Porphyromonas (or the polymptide) and a pharmaceutical carrier, fragment, or single-chain antibody) and a pharmaceutical carrier, (or the polymuclectide) and a pharmaceutical carrier, (or the polymuclectide) and a pharmaceutical carrier, or the polymuclectide in a test sample, detecting the presence of a proportion and a pharmaceutical carrier, and a pharmaceutical carrier, proportide in a test sample, detecting the presence of a proportion in a test sample, detecting the presence of a proportic antibody in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting the presence of a proportic in a test sample, detecting to a proportic in a test sample, detecting to a proportic in a proportic in a test sample, detecting t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                         P. gingivalis W12 cysteine protease, porphypain (AAR96029), was identified as the product of the prtP gene (AAT30653) isolated from P. gingivalis W12 genomic DNA. The porphypain shows homology to the haemagglutinins (see also AAR96026-28 and AAR96030-33) of P. gingivalis 138. It can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The porphypain and haemagglutinins can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Periodontal disease; cell surface protein; thiol protease; endopeptidase;

Comprises a 300 kDa complex composed a 48 kDa lysine-specific thiol comprises a 300 kDa complex composed a 48 kDa lysine-specific thiol protease and 39, 15 and 44 kDa adhesins encoded by the ptrK gene (AAT78851), and a 45 kDa arginine-specific thiol protease and 44, 15, 17 and 27 kDa adhesins (see AAW24786) encoded by the ptrK gene (AAT78850). A complex complex comprises at least one multimeric protein complex having a mol.wt. of over 200 kDa, and preferably comprises all 9 proteins of the PtrK-PtrK complex (see also AAW24780-85). It can be used in a claimed composition to allicit an immune response directed against PG, and in a claimed method of reducing the prospect of PG infection and/or severity of disease. Antibodies directed against the complex are claimed for use in treating PG infection. Unlike whole PG cells or other previously prepared antigens based on fimbriae or the capsule, the PtrR-PtrK complex or component parts are safe and effective antigens. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antigenic protein complex from Porphyromonas gingivalis - comprising Arg- and Lys- specific thiol endo-peptidase(s), used in the detection, prevention and treatment of periodontal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

periodontal disease. The marker comprises a cysteine protease derived from a Porphyromonas gingivalis microbe. The invention further comprises: a periodontal disease ward appearance kit, comprising a sampling tool, periodontal disease marker, synthetic substrate, buffer, and a reducing agent. The periodontal disease marker is useful for detecting and diagnosing periodontal disease from saliva. The periodontal disease marker provides reliable and convenient detection of periodontal disease and provides simultaneous detection of angina and diabetes. This sequence represents a human cysteine protease related protein of the invention.
                                                                                                                  relates to a novel periodontal disease marker for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P. gingivalis 381 haemagglutinin hagD (AAR96032) was identified as the product of the second open reading frame of the hagD gene (AAR30655) derived from P. gingivalis 318 genomic DNA. A first open reading frame coded for hagD protease (see also AAR96031). The protease and haemagglutinin can be obtd. from transformed host cells and used in vaccines to protect humans or animals against periodomical disease. Expression in Salmonella cells allows prodn. of live vaccines. The haemagglutinin and protease can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               detection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the prtP haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                   Isolated Porphyromonas gingivalis genes - encoding haemagglutinin and/or
protease poly:peptide(s)).

The invention relates to a novel periodontal disease marker for detecting periodontal disease. The marker comprises a cysteine protease derived from a Porphyromonas gingivalis microbe. The invention further comprises: a periodontal disease ward appearance kit, comprising a sampling tool, periodontal disease marker, synthetic substrate, buffer, and a reducing agent. The periodontal disease marker is useful for detecting and diagnosing periodontal disease from saliva. The periodontal disease marker provides reliable and convenient detection of periodontal disease and provides simultaneous detection of angina and diabetes. This sequence represents a cysteine protease human Arg-gingipain (rgp) protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel periodontal disease marker for detecting periodontal disease, comprising cysteine protease derived from Porphyromonas gingivalis, useful for detecting periodontal disease, in saliva.

This sequence represents the hagD haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

                                                                                                                                                                                                                                                                               AAQ88141 encodes AAR72458 the Porphyromonas gingivalis lysine-gingipain protein complex (LGPC). The LGPC has amidolytic and proteolytic specificity for an amide bond, where lysine contributes the carboxyl gp., i.e. a lysine specific protease. LGPC can be used to identify agents that modulate the effect of LGPC on an animals, and also for monitoring the exposure of an animal to LGPC. Such a method can be used to monitor the progress of a therapy designed to lessen the symptoms of periodontitis
                                                                                                                                      Lys-gingipain complex prepn with amidolytic and proteolytic specificity for cleavage of an amide bond with Lysine contributing the carboxyl gp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Sequence 4, Application US/09490931

Sequence 4, Application US/09490931

Patent No. 6274718

GENERAL INFORMATION:

APPLICANT: Travis, James

APPLICANT: Parloff, Nadine

TITLE OF INVENTION: Porphyromonas gingivalis

TITLE OF INVENTION: Arginine-specific Proteinase Coding Sequences

NUMBER OF SEQUENCES: 16

CORRESPONDENCE ADDRESS:

ADDRESSEE: ADDRESS:

CITY: Boulder

STREET: 5370 Manhattan Circle, Suite 201
